

A VPN helps you to...

Protect yourself on public Wi-Fi

Even if you connect to an unsecure Wi-Fi network, hackers won't be able to spy on your activity.

Avoid internet censorship

Access news sites and social media while traveling in countries where internet use is restricted.

Strengthen your privacy

Stop your internet service provider from logging and selling information about your browsing habits.

Limit bandwidth throttling

Your ISP might slow down your internet if you're using a lot of bandwidth, but if your activity is private your ISP can't single you out for throttling.

Supercharge your gaming experience

With a lightning-fast VPN and protection from DDoS attacks, you can play to your full potential.
